

Welcome to Stable 1

Stable 1 is an AI-powered camera solution for a horse’s health and well-being.

It helps you better understand what is happening with your horse in the stable — quietly, continuously, and without interfering with daily routine.

This guide explains how Stable1 collects behavioural data, what each block in the app represents, and how to interpret the information you see.

What Stable1 is – at a glance

Camera-based behavioral equine monitoring

Runs continuously without manual input

Learns what is normal for each individual horse

Designed by a vet and horse owner

Non-invasive

Provides behavioral context, not diagnoses

Important to keep in mind

Stable1 is a monitoring tool, not a veterinary service, and does not diagnose or replace professional veterinary judgment.

Data is provided for behavioural context and long-term trend observation and should always be interpreted alongside professional advice and individual horse circumstances.

Key Features Available January 2026

● Incident Alerts

- +

 Early Colic detection
- +

 Casting Detection
- +

 Birth Alarm

When the system detects an incident, the user gets an alarm on their smartphone.

● 24/7 Monitoring

The system analyses your horse’s behaviour and activity patterns, providing structured insights and timely updates based on observed changes.

- +

 Hay & Hunger Monitoring
- +

 Stress Level Monitoring
- +

 Time Outside the Box
- +

 Rest and Activity Tracking
- +

 Water Intake Monitoring
- +

 Lying Down Time Tracking

● Highlights

Have fun and share the joy with ‘Highlights’.
Never miss a moment of your horse's secret stable life!

Our AI keeps a close watch on your horse, capturing one-of-a-kind moments and saving them in the Highlights section.
Whenever your horse does something remarkable, you can effortlessly share these memories with friends or post them on social media to brighten everyone's day.

How it works

Stable1 analyses video from stable cameras to observe everyday horse behaviour.

Using AI-based motion and posture tracking, the system continuously detects movement, rest, and routine within the stall.

Over time, Stable1 learns what is normal for each horse and helps highlight changes that may matter for daily care.

+

 Early Colic Detection

Stable1 monitors behavioural patterns that may be associated with colic-related discomfort, such as reduced feeding or drinking, repeated lying down and getting up, rolling, restlessness, or prolonged inactivity.

The system evaluates the frequency and intensity of these behaviours in relation to the horse’s usual baseline. When meaningful deviations are detected, Stable1 highlights unusual behaviour or issues an alert to support timely attention and further assessment.

+

 Casting Detection

With casting detection, our AI system keeps an eye on your horse’s position, sending an alert if it detects that the horse might be stuck. This allows you to act quickly and help your horse if needed.

+

 Stress Level Monitoring

Stress Level helps you understand how your horse’s behaviour changes compared to the baseline.
We don’t measure “stress” directly. Instead, Stable 1 looks at your horse’s behaviour on video and spots movement patterns that are often linked to tension or activity bursts.

The system continuously observes your horse and looks at what has been happening over the last 5 minutes. We focus on the speed and type of macro-movements – large, whole-body movements such as: walking, turnings, jumps or hops.

Using this, we assign a Stress Level for each 5-minute period: Low, Medium or High.
This notification prompts you to monitor the situation more closely.

+

 Hay & Hunger Monitoring

Hay monitoring helps you understand your horse’s feeding behaviour. Stable 1 does not measure feed intake directly. Instead, the system analyses your horse’s posture and activity on video, combined with their location within the stall, to identify behaviour commonly associated with eating hay.

Stable 1 helps highlight changes that may indicate reduced appetite or limited access to hay, supporting day-to-day care and wellbeing monitoring.

+

 Time Outside the Box

Time outside the box helps you understand how much time your horse spends outside the stall as part of their daily routine.

Changes in time spent outside the box may help highlight shifts in daily management, exercise schedules, or turnout patterns and provide useful context for routine care.

+

 Water Intake Monitoring

Stable1 detects your horse’s head position and presence in the water area, recording the timing and duration of water-related visits. Over time, this helps build a picture of your horse’s typical drinking behaviour.

+

 Rest and Activity Tracking

Stable1 observes how active your horse is throughout the day and identifies periods of consistently low movement, when the horse is resting either standing or lying down.

These periods are treated as rest and added together to show total daily rest time in hours and minutes.

This helps you understand how much time your horse spends resting and recovering.

+

 Lying Down Time Traking

This section helps you understand how much time your horse spends lying down each day and how this compares to their usual pattern.

Horses can rest while standing, but lying down allows deeper relaxation and is required for REM sleep. Changes in lying-down time over days or weeks can provide useful context when assessing rest quality and overall recovery.

Stable1 detects lying down by observing your horse’s posture on video and tracks the timing, duration, and total time spent lying down each day.

Questions or need help?

Stable 1 is designed to support daily horse care, and we know questions can come up along the way.

If you’d like clarification on any data or features, feel free to message us anytime on WhatsApp.

Or book a training session for your team to get the most out of Stable 1.
